

## DRILL DISCOVERY OF GOLDBEARING ZONE ON K2 WI TARGET, QUEBEC

**Montreal, Quebec, Canada –Dios Exploration Inc.** is very pleased to report partial results with a first gold-bearing zone discovered by drilling the WI TARGET area, first ever drilling on wholly-owned K2 property, directly southwest of Azimut's Elmer gold property, James Bay Eeyou Istchee, Quebec.

More precisely on PP-1 anomaly, 1.5 km west of Kali intrusive, a poorly outcropping area, hole K2-2020-01 intersected **medium-coarse grained tonalite grading 8.92 g/t gold over 1 m (352-353m) in contact with a strongly foliated mafic dyke with 0.5% pyrite-pyrrhotite disseminated in foliation.** It is open in all directions and seems associated with the

hanging wall of a significant resistivity anomaly, at the contact between a high and low magnetic area.

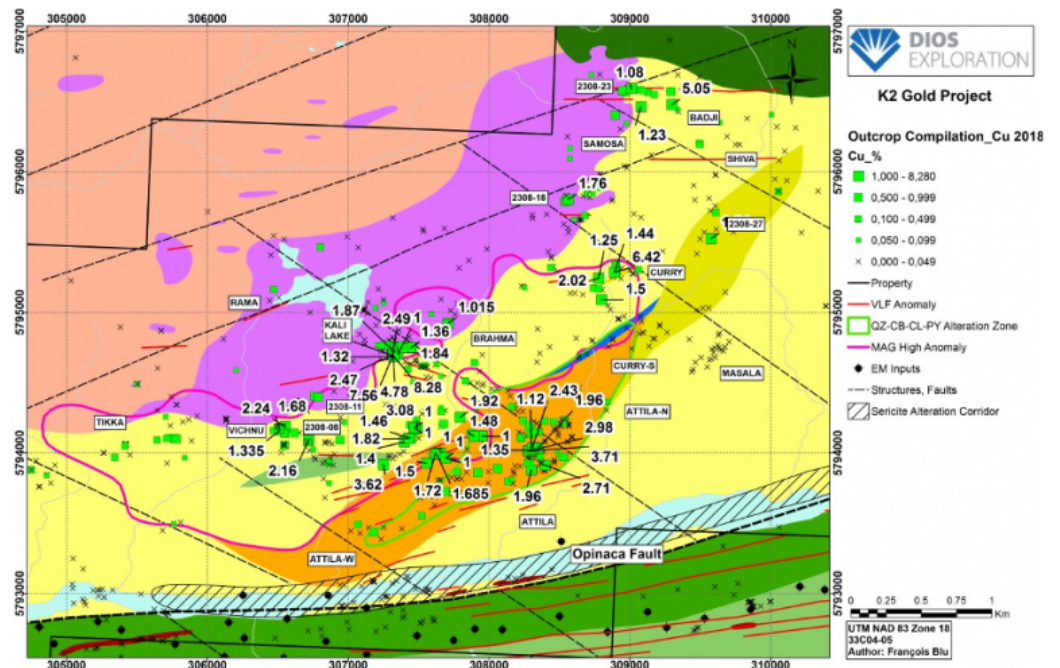

Located 200 m northeast, hole K2-2020-03 cut 0.5 g/t gold/1m (183-184m) in another such IP horizon, but also no volcanic rocks that could be the source of soft & crumbly mineralized/sericitic dacite boulders grading up to 6.72 g/t gold in the WI target area. Good NE up-ice targets such as: 1.) the significant 10 to 20 meter large Curcuma shear zones and 2.) the southern contact between Kali pluton and adjacent volcanics (along the enriched gold-in-till drumlin feature) remain untested. So further soil and rock sampling and IP survey is warranted in that NE area to define further drill targets. See map.

This K2-Solo claim block property, wholly owned by Dios without any royalties, covers 83.5 hectares (158 claims). There were extremely long delays at the assay office in Val d'Or ALS but results should get out sooner now. Drilling is already planned for next quarters. Several other areas of K2 gold property warrant further ground investigations, prospecting and drilling. Technical

content of this release was prepared by M.J. Girard Geo M.Sc., 43-101 Qualified Person.
